

BME60A Capstone Project

Automated Medication Dispenser

**Group 4: Pranauv, Natalie,
Kaylyn, Ashley, & Davey**

Purpose of Product

Create an automated pill dispenser to help people organize their pills and avoid having another thing to remember every day that could have dire consequences if they were to forget.

Project Goals

- Create a functioning medicine dispenser utilizing servo motor, LEDs, buttons, & buzzer
- Create a functioning code that can rotate the dispenser to dispense pills either daily, weekly, or biweekly
- Collaborate with one another to reach project milestones! :)

Wiring Schematic

Code Logic (1)

Code Logic (2)

Functioning Electronics

Preliminary Design (Bottom)

Mount servo on LID

Add compartments to
bottom section

Final Design

Mount servo on bottom

Prototype

Future Directions

- Integrate Electronics with our 3D print
 - Get a stronger servo (There are higher-torque servos on the market for this purpose)
- Introduce different modes
 - Allow user to selected specific days or a different schedule etc.
- Decrease the size of the medication dispenser so it's more portable
